

ทฤษฎี และสิ่งที่ต้องรู้เกี่ยวกับ ไมโตคอนเดรีย

บุษบา ฤกษ์อำนาจโชค

Outline :

- บทนำ
- ความรู้ทั่วไปเกี่ยวกับไมโตคอนเดรีย
- การใช้ไมโตคอนเดรียในงานด้านนิติเวชศาสตร์
- การแปลผลการตรวจไมโตคอนเดรียทางนิติเวชศาสตร์

บทนำ

Conventional STR typing systems do not work in every instance :

Ancient DNA specimens / highly degraded samples often fail to produce results with nuclear DNA.

Because of high copies of mtDNA, the probability of obtaining mtDNA result is higher than nuclear DNA

บทนำ

Autosomal DNA marker

Mendelian transmission

บทนำ

Lineage marker

- Y chromosomal DNA
- mtDNA

Pass down from generation to generation without changing (except mutation)

From: <http://www.garlandscience.com>

ความรู้ทั่วไปเกี่ยวกับ ไมโทคอนเดรีย 1

Comparison of nuclear DNA and mtDNA

characteristics	nuclear DNA	mtDNA
Size of genome	~ 3.3 Billion bp	~ 16,596 bp
Copies per cell	2 (1 alleles from each parent)	can be >1,000
Percent of total DNA per cell	99.75%	0.25% content
Structure	linear, packaged in chromosome	circular

Butler JM 2012

ความรู้ทั่วไปเกี่ยวกับ ไมโทคอนเดรีย 2

Comparison of nuclear DNA and mtDNA

characteristics	nuclear DNA	mtDNA
Inherited from	Father and mother	mother
Chromosomal pairing	Diploid	Haploid
Generational recombination	Yes	No
Replication repair	Yes	No

Butler JM 2012

ความรู้ทั่วไปเกี่ยวกับ ไมโทคอนเดรีย 3

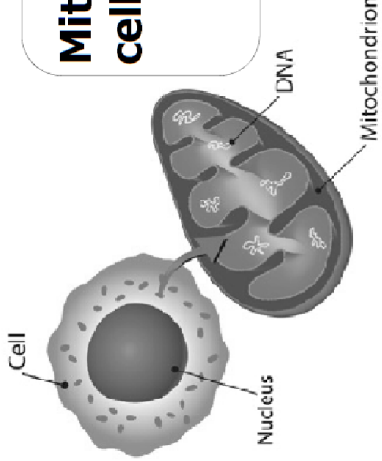

Comparison of nuclear DNA and mtDNA

characteristics	nuclear DNA	mtDNA
unique	Unique to individual (except identical twins)	Not unique to individual (same as m)
Mutation rate	Low	At least 5-10 times nDNA
Reference sequence	Described in 2001 by the Human Genome Project	Described in 1981 by Anderson et al.

Butler JM 2012

Comparison of nuclear DNA and mtDNA		
characteristics	nuclear DNA	mtDNA
Occurrence in human genome	~ 1 in every 15 Kb	~ 1 in every 1 Kb
General informativeness	high	Low, only 20-30% as informative as STRs
Marker type	Di-, tri-, tetranucleotide repeat markers	Bi-allelic markers
Number of alleles per marker	Typically > 5	Typically 2
Detection method	Gel/CE	Sequencing, microarray
Butler JM 2001		

Average mtDNA/mitochondria : 4-5 copies
Satoh & Kuroiwa 1991

Mitochondria/ cell : hundreds
Robin & Wong 1988

Average mtDNA/ cell : ~ 500 copies
Satoh & Kuroiwa 1991

➔

Greater success with biological samples that may be damaged with heat and humidity than nDNA

Mitochondria have circular genomes : A scanning electron micrograph of mitochondrial DNA.

Hudson, B. *et al.* 1967

The mitochondrial genome is densely packed with genetic information

2 mtDNA strands have significantly different base composition :
 - heavy (H) strand is richer in G
 - light(L) strand is richer in C

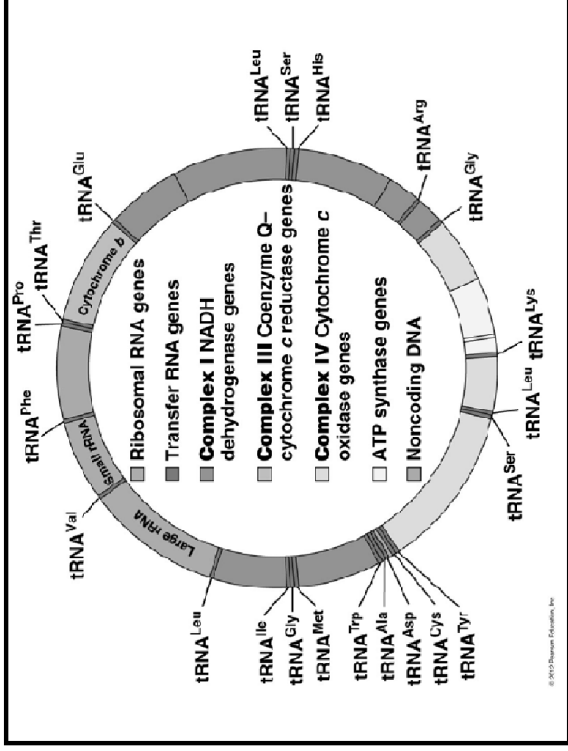

mtDNA ~ 16,569 bp

mtGenome contains for 37 gene products

Non-coding region (D-loop) or control region
 Coding region
 encode
 - 13 proteins
 - 22 tRNAs
 - 2 rRNAs

Taylor et al 2005

1. The coding region :

responsible for the production of various biological molecules involved in the process of energy production in the cell.

2. The non-coding region :

responsible for regulation of the mtDNA molecule.

Non-coding region (D-loop) or control region

Greenberg et al. 1983

Two regions of mtDNA within the non-coding (control) region are highly polymorphic, or variable, within the human population

Hypervariable Regions

Hypervariable Regions

16,024 - 16,365

1. Hypervariable Region I (HV1)

position 16,024 ~ 16,365
~342 bp length

2. Hypervariable Region II (HV2)

position 73 ~ 340
~ 268 bp length

Hypervariable Regions

Forensic mtDNA examinations are performed using these two regions (HV1 and HV2) because of the high degree of variability found among individuals.

HV3 shows less polymorphic than HV1 and HV2 but may resolve some cases where additional discrimination is desired.

Human mtDNA reference sequences

First sequenced in 1981 in the laboratory of Frederick Sanger in Cambridge, England (Anderson et al. 1981)

- **Anderson sequence /**
- **Cambridge reference sequence**

The sequence was derived primarily from a single individual of Europe descent and it also contained some HeLa and bovine sequences to fill in gaps resulting from incomplete sequencing procedure (Anderson et al.1981)

Revised Cambridge reference sequences (rCRS)

In 1999, the original placental material used by Anderson and co-workers to generate the CRS was re-sequenced (Andrews et al.1999)

With the improvements in DNA sequencing technology, the reanalysis effort confirmed all of the original nucleotides published but 11 positions were corrected.

Other interesting differences between mtDNA and nDNA

- mtDNA uses a different genetic code than nDNA (Scheffler 1999)

mtDNA : UGA --- tryptophan

nDNA : UGA --- stop codon

mtDNA : AUA --- methionine

nDNA : AUA --- isoleucine

Other interesting differences between mtDNA and nDNA

- Fewer DNA repair mechanisms exist in mitochondria

Higher mutation rate than nDNA

More variability in samples from identical maternal lineages

Other interesting differences between mtDNA and nDNA

- Circular nature of mtDNA makes it less susceptible than nDNA to exonuclease that break down DNA molecules
- The encapsulation of mtDNA in a two-walled organelle enhances mtDNA survival rate.

Revised Cambridge reference sequences (rCRS)

Two forms of heteroplasmy in mtDNA :

1. Sequence heteroplasmy (**point heteroplasmy**) is the occurrence of more than one base at a particular position or positions in the mtDNA sequence.
2. Length heteroplasmy is the occurrence of more than one length of a stretch of the same base in a mtDNA sequence.

During cell division, the multiple mtDNA molecules in a dividing cell segregate in a random way to the two daughter cells.

At cell division, the mitochondria and their genomes are randomly distributed to the daughter cells, a process known as replicative segregation.

Causes of Heteroplasmy

- Molecular events not quite understood
- Most probable explanation: mutations in female germ line followed by subsequent differentiation during embryonic development
- HVI and HVII (Hypervariable sequences) are typically analyzed for forensic use
- Hotspots are prone to heteroplasmy

Heteroplasmy and Human Hair

- Human hair has high frequency of heteroplasmy
- Example: hair from same individual may have different mtDNA
- Although hair contains heteroplasmy, other tissues from same individual may not, i.e. blood, muscle, skin

Heteroplasmy complicates forensic mtDNA testing

- May not always be detected depending on the tissue type and analysis procedure
- May be difficult to form a basis of exclusion
 - In case of non-mutation, sequence frequency is determined from a mtDNA database

Heteroplasmy Benefits Forensic mtDNA Testing

- Rarity of a particular heteroplasmy may increase discriminating power

Table 2. Actual casework example in which heteroplasmy was found

Sample	mtDNA position 16090
Q hair	T/C
R blood	T
R hair 1	T
R hair 2	T
R hair 3	T
R hair 4	T/C

Q, questioned
R, reference

Summary of heteroplasmy

- An individual may have different versions of mtDNA
- Heteroplasmy may complicate mtDNA testing, but may also make it more efficient
- Tissue type is important when analyzing mtDNA
- Standardization is needed in mtDNA testing procedures

การใช้ไมโทคอนเดรียในงาน ด้านนิติเวชศาสตร์

Reasons for using mtDNA analysis

• These markers occur in males and females and are inherited through the maternal line.

• Forensic Casework

** Analyze sample materials that are not suitable for nuclear DNA

** Test hair strands without the root

** Test highly degraded tissue

** Test skeletal remains Maternity Testing

• Sibling Studies (from the same mother)

• Grandmaternity (from the same grandmother)

• Maternal kinship analysis

Forensic application :

Mitochondrial DNA analysis is an appropriate method for:

- Charred remains
- Degraded specimens
- Old skeletal and fingernail samples
- Hair shafts

การแปลผลการตรวจวิเคราะห์

ผลการตรวจวิเคราะห์ : ไม่ชัดเจน (Identical)
หมายถึง ลำดับนิวคลีโอไทด์ของบุคคลที่นำมาเปรียบเทียบกันจะมีชนิดและตำแหน่งนิวคลีโอไทด์ที่แตกต่างจากลำดับนิวคลีโอไทด์อ้างอิง (rCRS, 1999) เหมือนกันทุกตำแหน่ง

การแปลผลการตรวจวิเคราะห์

ผลการตรวจวิเคราะห์ : ชัดแจ้ง (Unidentical)
หมายถึง ลำดับนิวคลีโอไทด์ของบุคคลที่นำมาเปรียบเทียบกันจะมีชนิดและตำแหน่งนิวคลีโอไทด์ที่แตกต่างจากลำดับนิวคลีโอไทด์อ้างอิง (rCRS, 1999) ไม่เหมือนกัน 2 ตำแหน่งขึ้นไป

การแปลผลการตรวจวิเคราะห์

ผลการตรวจวิเคราะห์ : ไม่สามารถสรุปผลได้ (Inconclusive) หมายถึง ลำดับนิวคลีโอไทด์ของบุคคลที่นำมาเปรียบเทียบกันจะมีชนิดและตำแหน่งนิวคลีโอไทด์ที่แตกต่างจากลำดับนิวคลีโอไทด์อ้างอิง (rCRS, 1999) ไม่เหมือนกันเพียง 1 ตำแหน่ง

ข้อจำกัดในการรายงานผล

การแปลผลการตรวจวิเคราะห์ทั้งสามกรณีข้างต้น จะไม่นำนิวคลีโอไทด์ในบางตำแหน่งมาแปลผลร่วมกับนิวคลีโอไทด์ที่ตำแหน่งอื่นๆ ดังนี้

- ตำแหน่งนิวคลีโอไทด์ที่ 16193 ของ HVR I ซึ่งเป็นบริเวณ C- Stretch ที่ไม่สามารถระบุจำนวนนิวคลีโอไทด์ C ที่แน่นอนได้
- ตำแหน่งนิวคลีโอไทด์ที่ 309 ของ HVR II ที่มี insertion ของนิวคลีโอไทด์ C จำนวนไม่เท่ากัน

ข้อเสนอแนะในการรายงานผล

กรณีที่ผลเป็น Inconclusive

ให้ปฏิบัติตามคำแนะนำการตรวจวิเคราะห์ซ้ำอีกครั้ง โดยเริ่มต้นตั้งแต่ขั้นตอนการสกัดสารพันธุกรรมตีเอ็นเอจากตัวอย่างเดิมจนเสร็จสิ้นขบวนการ หรือทำการวิเคราะห์โดยเพิ่ม region ในการทดสอบเพิ่มขึ้น หากได้ผลการตรวจวิเคราะห์ที่ไม่แตกต่างจากเดิม จะแปลผลการตรวจวิเคราะห์ว่า “ไม่สามารถสรุปผลการตรวจวิเคราะห์ได้”
